Revised 2026-11-03

Simple Ground Equipment & Services

Quick start

Simple Ground Equipment & Services displays or hides static objects around your aircraft on the ground. Among other things, SGES can control the X-Plane 12 aircraft carrier and frigate, display an active runway barrier, display a car or a ship accident site in the vicinity, and so on. Crafted in X-Plane 12 with retro-compatibility to some extend to X-Plane 11.55.

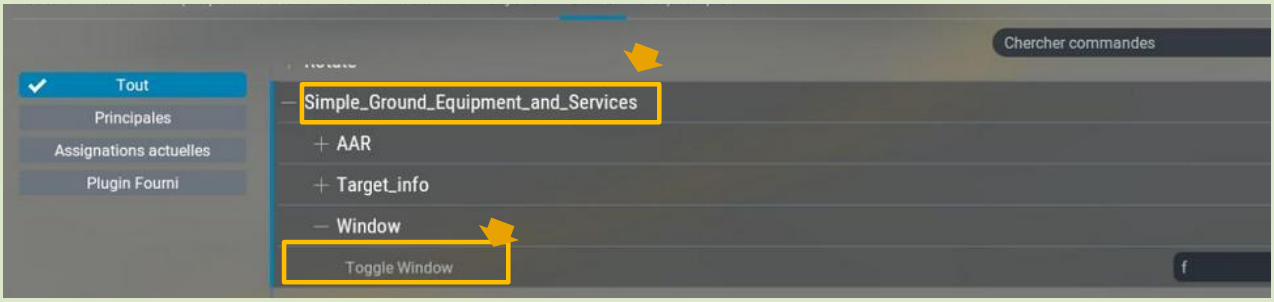

Installation

1) Install FlyWithLua NG for X-Plane 11 or FlyWithLua NG+ for X-Plane 12

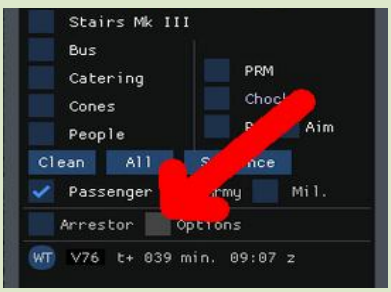

2) Drop all files and folders into : X-Plane [*11*/*12*]/Resources/plugins/FlyWithLua/Scripts

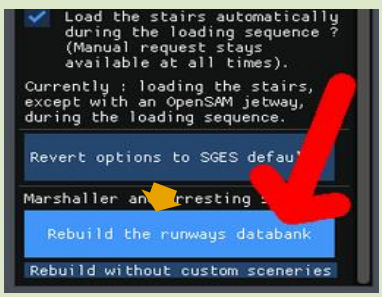

The resulting installation shall respect the following architecture:
plugins/FlyWithLua/Scripts/Simple_Ground_Equipment_and_Services.lua
plugins/FlyWithLua/Scripts/Simple_Ground_Equipment_and_Services
plugins/FlyWithLua/Scripts/Simple_Ground_Equipment_and_Services_expanded_documentation

3) Open the keyboard menu in X-Plane and attribute a key to toggle our menu

4) Build a databank of all parking positions and runways for the marshaller and the arresting system: Open the SGES menu. → Select "Options" → Click on *"Rebuild the runways databank"*

Please wait a few minutes while we scan all default and custom sceneries.

What if the text in the SGES in-game menu isn't great?

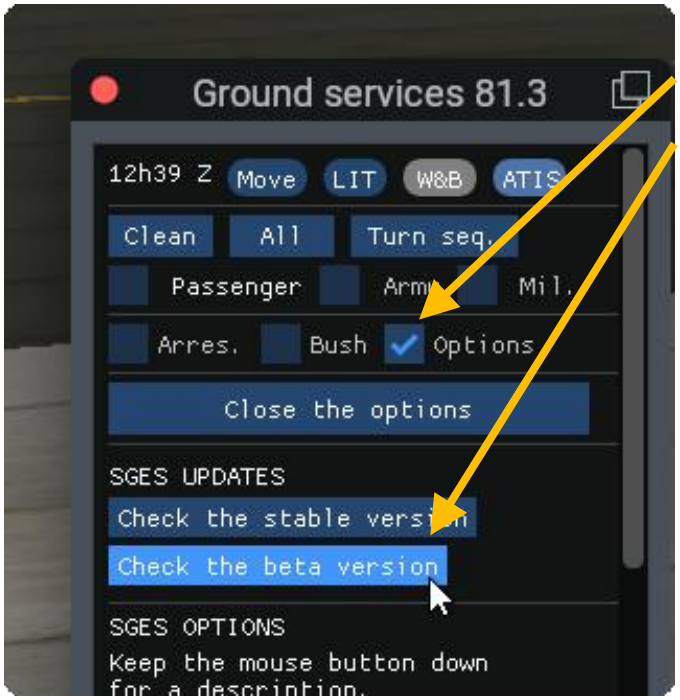

After FlyWithLua 2.8.16, fonts have changed. The default font is now anti-aliased. On some computers it might look a bit blurry. If you wish, it's possible to tell FlyWithLua to revert to the legacy, sharp, non aliased, font.

In FWL 2.8.17 and above, go into

X-Plane 12/Resources/plugins/FlyWithLua/fwl_prefs.ini

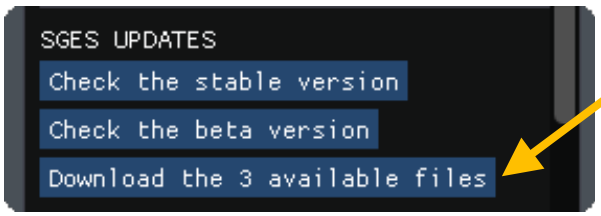

and change the value of **ProggyCleanDefault** to **1**.

Updating SGES

1) Open the options

2) Select your preferred incremental update: either the stable channel or the beta release. Press the corresponding button.

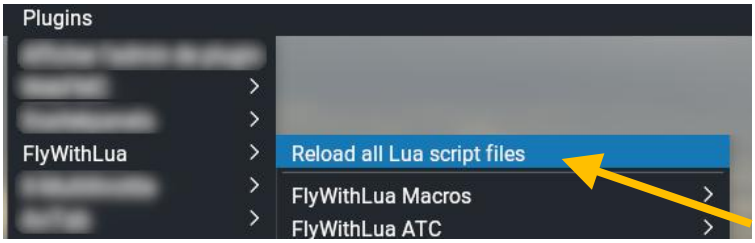

When an update is available you will then be notified that a number of files are available.

The X-Plane console has more details, should you need to check the files which are about to be updated:

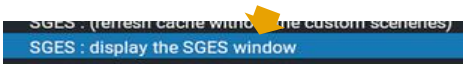

3) Now you can install the update by clicking on the download button.

4) Reload all Lua scripts to finish.

Accessing the SGES menu in game

Press your keyboard key, set during the installation process, to open the ground services menu. You can also popup our control panel from the FlyWithLua menu.

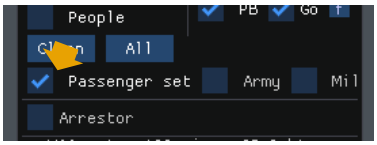

The menu is dynamic, it does not look always the same depending on the aircraft and situation loaded. For instance, the services available vary from aircraft to aircraft.

The ramp equipment

When the menu is open, tick the boxes as required to select individually a service.

- To avoid interfering with any aircraft systems, **those ground services are purely visual**. There is no active interaction with the sim, except for the deicing service (your aircraft will be actually protected from ice) and chocks.
- **Ground services** are displayed in the vicinity of the fuselage, but **not necessarily in contact to it**. The idea it to bring some life to the apron but to keep it simple.

Passenger / Army / Military set: alternative set of vehicles for passenger apron operations, cargo operations, military operations. ''Army'' does only appear when external assets are configured (see the manual).

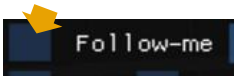

Bush mode: alternative set of vehicles suited for field operations. This options appears in the menu only with small planes in X-Plane 12.

Chocks: active chocks that actually retain your aircraft (as demonstrated in the picture above), allowing you to release the parking brake as required.

Follow-me: you can **select the follow-me** in the menu only when your taxi speed is below 30 kts.

The follow me car is not intelligent. It will turn when you steer your own aircraft nose wheel, so you're actually just pretending following him.

Options: many customizations are allowed in the in-game Options.
